

Endura

THERE'S A LITTLE GREEN IN EVERY COLOR

Endura's core material is sourced from a leading HDPE manufacturer in the United States, known for their non-polluting processes that conserve energy and natural resources. This ensures that the HDPE used in Endura products is economically produced, environmentally friendly, and safe for employees, communities, and consumers. The polymers are fully recyclable, and any material waste is recycled back into their products, minimizing waste generation.

When cutting or fabricating the HDPE, there is no harmful dust; instead, small shavings are recycled. It contains no known harmful substances, including carcinogens or toxins, and does not off-gas or emit harmful gases when burned. Additionally, it requires no acids or harsh chemicals for cleaning and maintenance.

Our dedication to sustainability is evident in the strategic sourcing of materials, as we partner with manufacturers known for their sustainable practices. By prioritizing sustainable sourcing, we contribute to the conservation of energy and natural resources while minimizing the ecological footprint of our products.

The core material used in ENDURA is sourced from a LEED Certified Manufacturer.
